

Level 1 Practice: Filtering Rows in a Listing Report Using Character Data

The **pg1.np_summary** table contains public use statistics from the National Park Service. The park type codes are inconsistent for national preserves. Examine these inconsistencies by producing a report that lists any national preserve.

1. Open **p103p04.sas** from the **practices** folder.
 - Add a WHERE statement to print only the rows where **ParkName** includes *Preserve*. **ParkName** contains character values, and these values are case sensitive.
 - Submit the program and view the results.

Note: If you use double quotation marks in the WHERE statement, you receive a warning in the log. To eliminate the warning, use single quotation marks.

```
proc print data=pg1.np_summary;  
  var Type ParkName;  
  where ParkName like '%Preserve%';  
run;
```

2. Which codes are used for preserves?

PRE, PRESERVE, and NPRE
